Epidemiology

Dr Hameed Othman

Lec. 4

Epidemiology of DiseasesCommunicable Diseases and NonCommunicable Diseases

Learning Objectives for the Lecture:

At the end of the lecture the student is going to be able to:

- 1. Define communicable and non-communicable diseases.
- 2. Describe the chain of infection.
- 3. Describe the links in the chain of infection.

Communicable Diseases

Communicable Diseases: They are diseases that spread by direct contact from infected person to a susceptible host.

Chain of infection: Series of events or conditions that lead to the development of communicable diseases.

Links in the chain are; the infectious agent (Pathogenic Microorganism), the reservoir, the agent's portal of inters the mode of transmission of the agent, a susceptible host, and the agent's portal of exit.

Pathogenic Microorganism:

The species capable of causing human disease are termed pathogens or Pathogenic Microorganism. There are five basic categories of biological etiologic agents: Protozoa, Metazoan, Bacteria, viruses and fungi.

Factors that enhance their capabilities to cause disease vary among the categories of biological agents as well as between members of any single category; this is according to their characteristics.

Characteristics of the infectious agent:

- 1. Morphology: Color, shape and size
- 2. Spores: The ability to produce capsules in order to survive.
- 3. Life cycle: The nature of life that the agent spends in the host body.
- 4. Viability: The ability to survive.
- 5. Pathogenicity: The ability to cause a disease and create pathological changes in the host body.
- 6. Virulence: The severity and damage that is created to the host tissue.
- 7. Infectivity: the ability to have access to the host system
- 8. Tissue selectivity.
- 9. Host selectivity.
- 10 Toxicity: the ability to produce toxin.

Reservoir: The natural habitat, in which an agent lives, grows and multiplies.

Types of Reservoirs:

- 1. Human: persons with symptomatic illness, or may be unapparent or chronic carriers.
- 2. Animals cows, pigs, sheep, raccoons, bats, dogs, cats, birds, rodents etc.
- 3. Environmental plants, water, food and soil.

Modes of Transmission:

It is the means by which the infectious agent which cause the disease transferred to a susceptible host.

Types for Modes of Transmission:

- 1. Air-borne transmission: The infectious agent is present in the air and inhaled (inspired) by susceptible host during respiration. Ex. Measles.
- 2. Feco-oral transmission. Ex. Hepatitis A, Salmonella.
- 3. Skin to skin contact. Ex. Dermatological diseases and STDs.
- 4. Transmission by direct inoculation, transmission through blood. Ex. AIDS, Hepatitis B, C and D.
- 5. Transmission by vectors. ex. Scabies, Malaria.

Portal of Entry: The means by which an infectious agent invades the host. This may include the respiratory tract, ingestion, dermal, blood borne, mucous membranes, etc.

Incubation period: It is the time between the entry of the infectious agents and the occurrence of clinical features.

Benefits of the incubation period:

- 1. Clinically for diagnosis and treatment.
- 2. Epidemiologically for preventive and therapeutic measures.
- 3. Administratively for budget, planning, implementation, and evaluation.

Non-communicable Diseases

Non-communicable (Infectious) Diseases: are those diseases that are not caused by a pathogen and cannot be shared or transferred from one person to another.

Causes of Non-Communicable Diseases:

- 1. The environment.
- 2. Nutritional deficiencies.
- 3. Lifestyle choices.
- 4. Genetic inheritances.

Unlike communicable diseases, non-communicable diseases are not communicable or contagious, although some kinds can be passed down genetically to the children of a carrier.

Examples of non-communicable include: ■

- 1. Many types of cardiovascular disease.
- 2. Chronic obstructive pulmonary disease caused by smoking tobacco.
- 3. Diabetes mellitus type 2.
- 4. Lower back pain caused by too little exercise.
- 5. Malnutrition caused by too little food, or eating the wrong kinds of food (e.g. Scurvy due lack of Vitamin C).
- 6. Skin cancer caused by radiation from the sun.

Characteristics of Non- Infectious Agents:

- 1. The extent to exposure to the agent (Infective dose) affects the ability to cause a health problem. EX. Alcohol, stress.
- 2. Infectivity of the agent (Asbestos, stress).

- 3. Pathogenicity (stress has low pathogenicity).
- 4. Virulence (stress-from mild stomach upset to suicide).
- 5. Chemical composition (poisoning).
- 6. Latency period.
